and B. M. Rubashev

Moscow 1948 Leningrad

TABLE OF CONTENTS

Foreward

Introductory Note

PART 1

SOLAR ACTIVITY

Chapter I. The Forms of Solar Activity

1. General data pertaining to solar activity.
2. Photospheric formations.
3. Chromospheric formations.
4. The solar corona.
5. The indexes of solar activity.
6. Solar observation service.

Chapter II. Cyclic Changes in Solar Activity

1. Solar cycles. The Schwabe-Wolf law.
2. Regularities in the latitudinal distribution of solar activity. The Schperer law.

3. The cycle curve analysis.
4. Comparison of activities of solar hemispheres during the 11-year cycle.
5. The life duration of groups of sun spots and the 11-year cycle phase.
6. Distribution curves for the duration of the existence of sun spots and protuberances.
7. The connection between cycles.
8. Solar activity oscillations having a duration of over 23 years.

Chapter III. The Impulses of Solar Activity

1. Distribution of sun spots by longitude.
2. The mutual interdependence of various solar phenomena.
3. The concept of impulse of solar activity.
4. The change in the characteristics of individual solar phenomena during the impulse of solar activity.
5. Vorticity movements in the active regions.
6. The physical structure of the active regions.
7. The existence of active longitudes.

Chapter IV. The Geoactivity of the Sun

1. The radiation of eruptions.
2. Determination of the magnitude of the relative excess of ultraviolet radiation in the active regions on the basis of the Stromgren theory.
3. The Pulkovo Observatory index of ultraviolet radiation.
4. Emanation by the corona of short-wave radiation.
5. Emanations from the active regions of the sun in the area of radio frequencies.
6. Astronomical data corroborating the presence of currents of solar corpuscles.
7. Geophysical data corroborating the presence of currents of solar corpuscles.

PART 2

SOLAR ACTIVITY AND THE PROCESSES OCCURRING IN THE IONOSPHERE

Chapter 1. The non-disturbed Ionosphere

1. The non-disturbed solar radiation, and its ionization effect.

2. The ionization-recombination equation, its solution and effects.
3. Experimental data.
4. Results of ionospheric observations during solar eclipses.
5. Conditions in radio communications on a normal day.

Chapter II. Disturbances in the Ionosphere Induced by the Accelerated Intensity in the Ultraviolet Emission from the Sun

1. The 11-year cycle of critical frequencies.
2. The juxtaposition of ionospheric and solar data at small averaging ranges.
3. The Dellinger effect.
4. Geomagnetic phenomena accompanying the Dellinger effect.
5. Attempts at the interpretation of the Dellinger effect.

Chapter III. Disturbances in the Ionosphere Induced by the Effect of Corpuscular Radiation from the Sun

1. Latitudinal distribution of the declinations of critical frequencies of layer F_2 from their normal magnitudes.
2. Changes in the ionosphere during magnetic storms.
3. The sporadic layer in the ionosphere.
4. Change in the conditions of radio communication under the effect of corpuscular currents. Deductions.

PART 3

SOLAR ACTIVITY AND TERRESTRIAL MAGNETISM

Chapter 1. Changes in the Geomagnetic Field Induced by Non-Perturbed Solar Radiation

1. General data on the terrestrial magnetic field.
2. Solar-diurnal and lunar-diurnal variations.
3. The effect of the 11-year cycle of solar activity upon the diurnal variations of the geomagnetic field.
4. The vectorial diagrams of diurnal variations.
5. Changes in the range of the variations from day to day.

1. Latitudinal distribution of the declinations of critical frequencies of layer F_2 from their normal magnitudes.
2. Changes in the ionosphere during magnetic storms.
3. The sporadic layer in the ionosphere.
4. Change in the conditions of radio communication under the effect of corpuscular currents. Deductions.

PART 3

SOLAR ACTIVITY AND TERRESTRIAL MAGNETISM

Chapter 1. Changes in the Geomagnetic Field Induced by Non-Perturbed Solar Radiation

1. General data on the terrestrial magnetic field.
2. Solar-diurnal and lunar-diurnal variations.
3. The effect of the 11-year cycle of solar activity upon the diurnal variations of the geomagnetic field.
4. The vectorial diagrams of diurnal variations.
5. Changes in the range of the variations from day to day.

6. The Dellinger effect and the diurnal variations in the earth's magnetic field.
7. The theory of the diurnal variations.

Chapter II. Changes in the Geomagnetic Field Induced by Solar Activity

1. Types of magnetic perturbations.
2. Basic characteristics of magnetic storms.
3. Perturbation indexes for the geomagnetic field.
4. Connection between mean annual magnetic perturbation values with the 11-year cycle of solar activity.
5. Connection between magnetic perturbation and solar activity in the presence of averaging intervals of less than a year.
6. Individual juxtapositions of magnetic perturbations with various elements of solar activity.
7. The 27-day recurrence of magnetic perturbations.
8. Geomagnetic perturbations and the impulse of solar activity.

Chapter III. The Theories of Magnetic Storms

1. The Birkeland-Stormer theory.
2. The Chapman-Ferraro theory.
3. The Al'fren theory.
4. The ultraviolet theory of magnetic storms.

Chapter IV. New Data on the Nature of Geomagnetic Disturbances

1. The solid angle of the corpuscular radiation of the sun.
 2. The diurnal cycle of geomagnetic perturbations.
 3. The connection between magnetic perturbation and the absolute values of the geomagnetic elements.
 4. The reality of storm-time variation.
 5. General and polar storms.
 6. The annual cycle of magnetic perturbation.
 7. On the nature of the corpuscular solar radiation.
- Conclusion of Part 3.

PART 4

THE CONNECTION BETWEEN SOLAR ACTIVITY AND PHENOMENAL IN THE TROPOSPHERE

Chapter I. The Possibility of the Effect of Solar Activity
upon the Processes in the Troposphere

1. The reality of the integral solar radiation oscillations and the possibility of their effect upon processes occurring in the troposphere.
2. The possibility of the effect upon the troposphere of the radiation intensity oscillations in the individual parts of the spectrum and of the corpuscular solar currents.
3. Atmospheric ozone and its connection with the hothouse effect.
4. Atmospheric ozone and solar activity.
5. Juxtapositions of individual meteorological elements with solar activity.

Chapter II. Physical and Chemical Processes in the Earth's
Atmosphere and Their Connection with Solar Activity

1. The atmosphere as a colloid. The physico-chemical factor as a supplement to the thermodynamic conditions.
2. The condensation mechanism of the effect of the solar activity oscillations upon the processes occurring in the lower layers of the Earth's atmosphere.

3. The connection between cloud formation and precipitation and solar activity.

Chapter III. New Theories on the Subject "The Sun and the Earth's Troposphere"

1. The method of reflection.
2. Results of applying the method of reflection to the study of Arctic intrusions.
3. The connection between the seasonal processes and solar activity.
4. The results of applying the method of reflection to the study of the Azorean intrusions.

Sources and Bibliography.
